## Background and objective

Rhinolaryngoscopes (RLS) used for rhinolaryngoscopy, are classified as a semi-critical medical device. The need for reprocessing and repairs are avoided with single-use RLSs since they are disposed after each procedure.

This study aimed to evaluate the organisational impact of single-use RLSs compared to reusable RLSs.

## Methods

To investigate the organisational impact, three surveys were administered to managers, clinicians, and nurses at five hospitals in the UK and Ireland. Preferences for a particular RLS or indifference were determined in ten categories of organisational impact, and a Chi-square test was conducted to determine whether there were statistically significant differences.

## Organisational Impact

Organisational Impact	Single-use	Neutral	Reusable	p-value
Work process or health care production	37	31	32	0.2602
Patient pathway	61	26	14	0.0001
Patient flows	35	36	30	0.6556
Type and level of involvement of the patient/ care	53	30	16	0.0005
Training requirement and skills needed	54	25	21	0.0001
Cooperation and communication modes	48	26	25	0.0076
Vigilance and monitoring method	49	35	16	0.0001
Working conditions and safety	60	29	11	0.0001
Budget allocation	48	24	29	0.1353
Logistics	57	22	22	0.0001

**Table 1:** Percentage of clinicians, nurses and managers (n=156) choosing either single-use, neutral or reusable rhinolaryngoscopes as having the most favorable organisational impact within each category.

Health care professionals perceived single-use rhinolaryngoscopes to have a better organisational impact compared to reusables in most categories

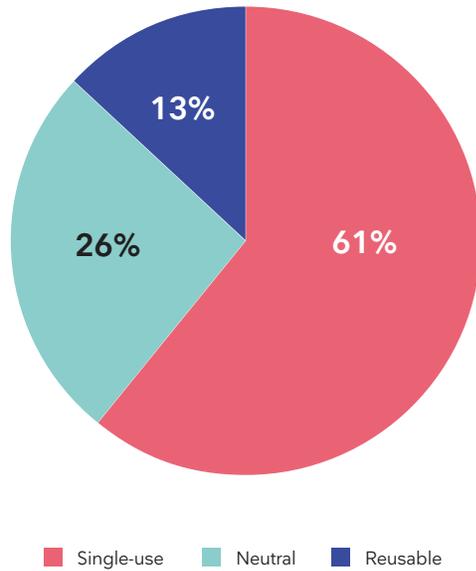

## Results

A total of 156 participants responded to the survey. 21 managers, 74 clinicians, and 61 nurses from outpatient clinics, intensive care units (ICUs), emergency departments, and endoscopy units. In nine out of ten categories, single-use RLS had a better organisational impact compared to reusable RLS. Of these, seven categories showed statistically significant results ( $p < 0.05$ ) in favour of the single-use device. These categories were: 1) Patient pathway, 2) Type and level of involvement of the patient/carer, 3) Training requirement and skills, 4) Cooperation and communication mode, 5) Vigilance and monitoring method, 6) Working conditions and safety, 7) Logistics. Categories that were not statistically different included patient flow, budget allocation and work process or health care production.

## Conclusions

This study shows the potential organizational benefit associated with single-use rhinolaryngoscopes.

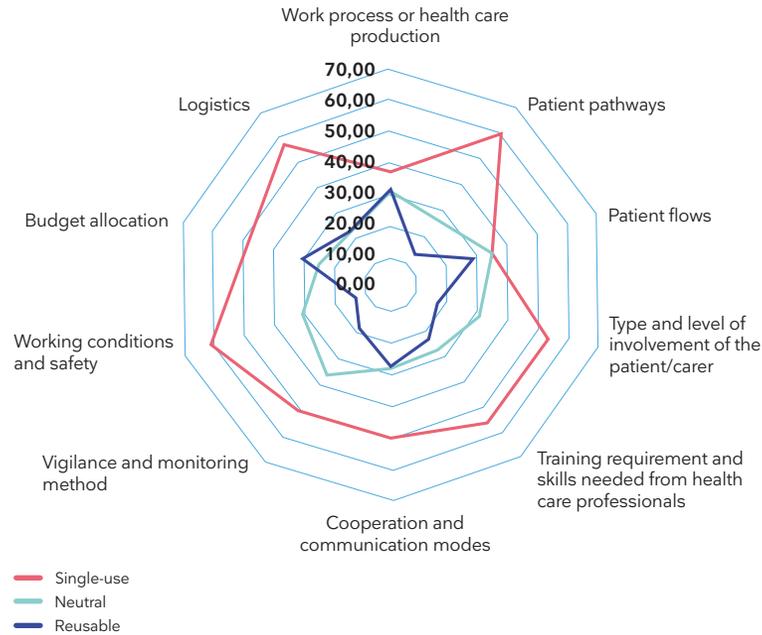

### Survey example

**Figure 2:** Example from survey with according preferences. The following question was included in the organisational impact survey to clinicians: “When performing a rhinolaryngoscopy, when do you experience the least need for transportation of the rhinolaryngoscope to the patient or transport of the patient to the rhinolaryngoscope?”

Chart demonstrating the opinions of 74 clinicians on the organizational impact of single-use and reusable rhinolaryngoscopes. Out of the total sample, 61% (n=45) perceived single-use, 26% (n=19) were neutral and 13% (n=10) reusables when considering which scope led to the least need for transportation of the rhinolaryngoscope to the patient or transport of the patient to the rhinolaryngoscope.

### Organisational Impact

**Figure 1:** Spider diagram illustrating the percentage of clinicians, nurses and managers who favored either single-use (blue), reusable (grey), or remained neutral (orange) in each of the ten categories.

### Summary

The multicentre study evaluated the organisational impact of reusable rhinolaryngoscopes in comparison to single-use rhinolaryngoscopes. Three surveys were distributed to managers, clinicians, and nurses at five hospitals in the UK and Ireland. The results showed that single-use rhinolaryngoscopes had better organisational impact in nine out of ten categories, with seven categories showing statistically significant differences in favor of single-use devices. The study concludes that there are organisational benefits associated with single-use rhinolaryngoscopes.
